**Subject:** Condensstop Free Vapor Closed Circuit System

Since the time we have been manufacturing with Condensstop Free Vapor Closed Circuit Units system you have established in our factory, it has provided following advantages over the old system:

- No more condensstop maintenance costs and purchasing.
- The flash steam release was eliminated.
- It eased working system of boiler by sending high degree condensate to boiler.
- When the values obtained from the measurements made after the installation of the closed system and the values taken from the old system in the same months of the previous year were compared, a saving of 38% in coal consumption was achieved.
- Our use of chemicals by feeding less feed water to the boiler was reduced.
- Comparing to the old system there was a reduction in boiler blowdown.

**Remark:** Due to the existing boiler condensstop leakage, the feed water received at low temperature caused problems in the pressurization of the boiler. Leaks are prevented by The Closed System and the boiler was fed with high temperature feed water. That enabled the boiler to work more comfortably and consume less coal.

We would you like to state our gratitude to your company for solutions of this system is developed by Metantech and providing efficiency in our production process, and wish success.

Kind regards
